

# Computer Security

Here are a few recommendations on how to make your computer more secure.

- It is recommended that you use a specific computer dedicated to your business needs.
- Public or shared computers should be avoided when accessing online banking.
- Keep your computer and anti-virus updated.
- If wireless Internet is used for the business, ensure that the network is password protected.
- Do not use unsecure or public wireless networks.
- Be cautious of unsecure websites. Look for the signs of a secure website, such as the web address which will begin with 'https'. The 's' is for secure and/or a closed padlock (🔒https://) also means the site is secure.
