

# 3D Detection

Tagit 3D innovative new technology is one of the most effective systems in today's marketplace.

Due to the patented algorithm of the Tagit System, the detection of security elements occurs regardless of their orientation within the magnetic field. This results high detection rates when using a standard system.

Since most systems are based on a 2 dimensional detection algorithm, they are limited to a successful detection. They are restricted by the physical restraints of previous construction methods and cannot achieve a higher rate.
