SECONDHAND SMOKE

...is smoke that is exhaled or comes off burning tobacco, which is then inhaled by others, including nearby non-smokers and pets.

There is no safe level of exposure to secondhand tobacco smoke.

Secondhand smoke contains 7,000 chemicals, and at least 70 are known to cause cancer.

Babies exposed to secondhand smoke are at an increased risk for Sudden Infant Death Syndrome (SIDS).

Exposure to secondhand smoke is known to cause heart attacks, strokes and lung cancer.

Pets breathing secondhand smoke are 3 times more likely to develop cancer and breathing problems.

It is impossible to prevent cigarette smoke from filtering through the walls between units.

THIRDHAND SMOKE

...is the harmful residue that clings to virtually all indoor surfaces long after the secondhand smoke from a cigarette has cleared out.

Components found in thirdhand smoke have been proven to cause DNA damage.

Take steps to protect yourself and your family from secondhand and thirdhand smoke, such as making your home and vehicles smoke-free.
