Research Question:

How does communication technology use affect patient experience?

In phase 2 of **The CONNECT Project** we are interested in patient and clinician viewpoints on how the use of communication technology (such as SKYPE, FaceTime or telephone consultations) impacts on the patient experience of receiving Physiotherapy or Occupational Therapy at the Royal National Orthopaedic Hospital.

We would like to interview twenty patients with bone, joint or muscle problems to see what they think. In addition, we will be interviewing twenty clinical staff. Interviews will last for up to one hour.

If you would like more information, please email anthony.gilbert@nhs.net or call 020 8909 5280. Participant information sheets are available from reception.
