/ Corporate Overview

Shape Security: Reducing fraud and friction through security

Shape Security builds cybersecurity technology which not only stops attackers, but also reduces friction for good customers. Shape disrupts the economics of cybercrime, making it too expensive for attackers to commit online fraud, while enabling enterprises to more easily identify and transact with genuine customers on their websites and mobile apps. The world's leading organizations rely on Shape as their primary line of defense against automated (bot) attacks on their web and mobile applications. The Shape platform, covered by 55 patents, was designed to stop the most dangerous application attacks enabled by cybercriminal fraud tools, including credential stuffing (account takeover), fake account creation, and unauthorized aggregation. Today, the Shape Network defends 1.7 billion user accounts world-wide.
