The EAB20 has been successfully tested to an impact speed of 20kph and fully complies with AS 2890 for Parking Facilities, the performance of non-tested bollards is unknown.

Your typical Decorative Bollards are surface mounted or buried 200-300 mm below the ground and frequently with no concrete or steel reinforcement. This will make them incapable to stop vehicles even at speed of 5-10 kph. They can also be dangerous when impacted by an out of control vehicle, as they can become flying projectiles and possibly injure pedestrians.

"The ONLY Crash Tested Carpark Energy Absorbing Bollard on the Australian Market"
