

Mining Technology Company DataCloud Opens Offices on Burrard St in Vancouver

SEATTLE, April 10th, 2019 -- Innovative mining technology company [DataCloud](#) is thrilled to add Vancouver to its office locations where it can be closer to the Canadian mining scene. DataCloud helps mining clients improve their rock mass knowledge by providing advanced subsurface measurements and analytics. Mining is a large part of the Canadian economy and many industry participants are either based in Vancouver or listed on the VSE.

Being located close to their British Columbia-based clients will allow to seamlessly provide their services, which will help DataCloud customers increase production while reducing costs. In addition, the company plans to grow deeper roots within the community by increasing their appearances at trade shows, workshops, job fairs, and more.

British Columbia has a balanced and wide spread of mine types (coking coal, base metals, precious metals) and a good mix of producing properties versus exploration prospects. This combination of stability and geologic diversity is unique. DataCloud's new location puts field engineering and R&D efforts closer to their clients, which will facilitate innovation and productivity growth in the Canadian mining industry.
