RECON DYNAMICS

KNOW MORE. WORK SMARTER. GROW PROFITS.

IT'S A COMMON FRUSTRATION: Current project billing practices are deflating profit margins.

Project Managers are often being charged for assets not on site or in active use.

Management needs data regarding the location and actual usage of assets in order to fairly pass along costs by project.

Innovation Managers need a solution that integrates with existing systems and does not require manual intervention.

You asked and we answered

Recon's Operational Intelligence platform brings unprecedented speed and precision to project billing through its use of revolutionary smart sensor technology that enables automatic and seamless tracking of location and motion-based utilization of company-owned tools and equipment.
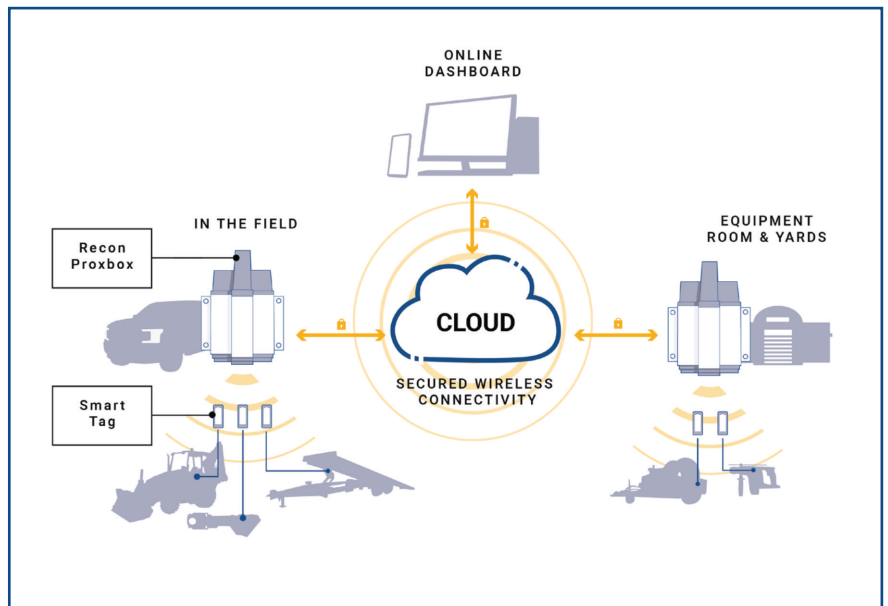

MORE DATA MEANS BETTER CHOICES.

Operational intelligence (OI) is a category of real-time analytics that delivers visibility and insight into business operations. It is knowing your business is operating as you expect, and being armed with data to drive efficiencies and increase your bottom line.

Recon's wireless OI technology offers better signal coverage, a more industrial design, and a hands-off automatic approach to monitoring that makes it an easy choice for contractors.

The solution consists of tiny, long battery life, wireless sensors known as Smart Tags installed in or onto assets and receivers known as ProxBoxes.

ProxBoxes continuously monitor for Smart Tag data reports and communicate wirelessly to Recon's cloud servers transmitting data regarding when, where and how often assets are used.

THE RECON ROI

With Recon, contractors know exactly where assets are on site, when they come and go, and whether they are in active use. When coupled with the fact that the Recon solution is designed to easily integrate with your existing proceses, it's billing made easy!
