

POCKET SPRING TECHNOLOGY

We use a 5 zone tempered spring steel pocket spring system. Its a 24cm spring compressed in to a 18cm pocket to ensure the spring system last longer as its been pre-compressed.

The unequal zoning is purposely done so that our beds will offer any body type exceptional spinal alignment and comfort. The larger reinforced centre falls under the heavier part of the body for better lower back support while the medium sections by the shoulders help prevent excessive pressure. The top and bottom (head and foot) section is reinforced to strengthen the seating edges.
