Finding the perfect tool

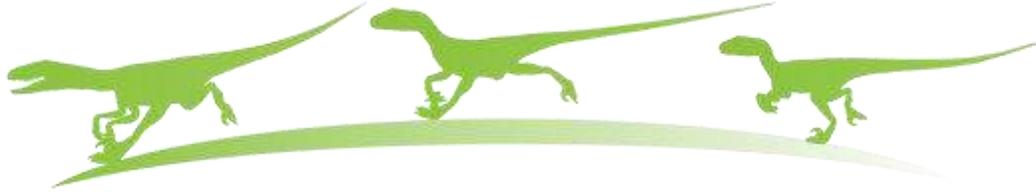

We humans have a fascination for improving things and our lives. These two needs, when put together create an inventive machine that cannot be stopped. This machine is what separates humans from many other inhabitants of our world. We are not the only creatures that use tools, but we certainly are the one with the most and more varied collection of tools.

Tools have been used by us humans since the dawn of early history, starting with tools made out of stone, wood, and sinew. Fast forward out of the stone age to the iron age, and we can find that in addition to longer lasting versions of the tools used in the stone age we now have a number of new tools to meet new needs brought about by our ingenuity to meet new needs and to make our lives easier. As we walk along the history lane we discover that tools are not only implements to assist us with manual labor, but have exploded into many areas of our daily lives, including tools to assist us with mental and behavioral tasks.

At some point in history we discovered that we were adding the same number to itself more than two times, the rules for multiplication were thus born, fast forward a few centuries and we discover that some multiplications are very large and prone to error. A few mathematicians developed the logarithms, which enable us to represent each number, add the numbers together, and then reverse to actual numbers to obtain the result, multiplication was then simplified. This method enabled the use of the slide rule to assist people to complete operations faster. Many designs of slide rules were created to assist in different areas of our lives, for example, scientists and salespeople to name two groups.

As we progressed, we started developing tools to assist us with mental and medical needs, tools that were not items that we pick up, use, and put back; instead these tools become part of our reasoning to deal with situations in our lives, they help us arrive at a solution and to clarify what it is that we need and how we get there.

The challenge is to find the perfect tool for the current need. If we need to nail a small brad to a piece of wood we are not going to use a 16-pound sledge-hammer to do the job. The same applies to any job at hand that we need to perform or any problem that we need to solve.
