

Baffle Intake & Soundboard Liner

Zephyr has several options to mitigate noise for blowers that will be placed inside the organ or near the performance space. These options include Soundboard Liners, Baffle Intakes, and [Sound Traps](#) on the output. These accessories not only help mitigate noise but also reduce turbulence.

NATURAL WOODFIBER SOUNDBOARD is one of the most effective ways to deaden sound. Zephyr has an option to line your enclosure with this product which provides superior noise attenuation.

BAFFLE INTAKES are an excellent way to effectively contain the sound of a blower. We use a Soundboard lined baffle intake which helps with noise abatement. This combination is the most effective in quieting the noise from the blower.
