

VMware Hybrid VDI Workshop

Desktops hosted in the cloud make it easier to implement a virtual desktop and app solution with a central control pane for the comprehensive provision and management of resources. With a desktop solution hosted in the cloud, your employees can flexibly and quickly access their desktops, no matter where in the world they are located. Most companies cannot switch everything from on-prem to cloud hosted desktops in one go, so in this workshop we will explore the hybrid cloud approach for your company.

What's this about?

Hybrid cloud desktops are desktop workloads that run in multiple data centers. This is usually a combination of on-premises and public cloud locations, but it can mean multiple public clouds or even multiple on-premises data centers. In the past, these deployments were completely independent of each other and had separate image, application, user, data and security management. Management often required different skills, and each update or configuration change required twice the effort.

Today VMware has solved the hybrid cloud problems by using a cloud-based common control or management layer with which each Horizon environment can be managed from a central panel.

VMware Horizon

A single VDI platform for the delivery of virtual desktops and apps, Horizon provides an integrated digital workspace where users can securely access everything they need from any device, from any location.

VMware Horizon Cloud

VMware Horizon Cloud enables the delivery of virtual desktops and applications from the cloud to on-premises and cloud-hosted workloads from a single cloud-based control plane.

Products included in this offering

- VMware Horizon Cloud
- VMware Horizon

High level project timeline

- 2 days

High level services

- Kick-Off Workshop
- Analysis of the current situation
- Development of a individual VDI Roadmap

What will we do together?

After a first kick-off workshop, which ensures that everyone is aligned with the goals, priorities and limits of the commitment, an analysis of the VDI environment takes place in order to answer the following questions:

- Can you expand or move applications on the current desktop infrastructure as quickly as the business needs?
- Do you have cost control over the desktop apps and infrastructure to cut costs when the company needs to cut back?
- Can you cost-effectively scale your implementation without requiring additional resources or overhead?
- Would it be valuable to you to be able to boot up brand new, personalized desktops in seconds? And delete them when you log out?
- What would happen if you had a major outage? Can you quickly and cheaply ensure that users can access their desktops and apps? How would this affect your business if your users were offline for a day?

- Do you have use cases that are ideal for the hybrid cloud, such as DR, business continuity, seasonal or event-based capacity, burst / temporary capacity, or just the need to expand your data center?
- How valuable would it be to reduce the security and compliance risks associated with data loss and image drift by simply moving desktop assets back into the data center and managing them?
- How valuable would it be to easily support secure end-user access to work-related apps and data from corporate and personal devices?
- If you had to update / patch an image or app for all your end users in your organization, could you? Do you expect such requirements that are difficult to meet with an on-prem solution?

These questions are of course only examples of what we can clarify in this workshop. Our consultant will deal with your situation individually and support you in sorting and evaluating the path going forward.

After the workshop, an individual report will be prepared that gives you clear recommendations for action that will help you decide.
