

End Source Code Theft

PROTECT YOUR INTELLECTUAL PROPERTY

A publicly traded Cyber Security Company (CSC) located in Silicon Valley, with 50+ in-house software developers and 100+ contract developers from several 3rd party consulting firms. CSC is also a Gartner Magic Quadrant leader, with over 3,000 customers in more than 80 countries.

The Challenge

CSC needed to ensure that their source code was not stolen or lost. A costly virtual desktop infrastructure (VDI) solution, was implemented to prevent misuse and add accountability for developers working with source code. This was met with resistance from their developers. They were extremely limited by VDI. Developers struggled with simple tasks like copying/pasting, taking screenshots, and collaborating. Despite employing VDI and other defense in depth strategies, source code was still lost. The scale of misuse is still unknown.

The Solution

CSC adopted SecureCircle's Data Access Security Broker (DASB). Now, all of CSC's source code is protected, transparently, without impacting developer productivity.

Upon checkout of any source code, the data is automatically encrypted and transparently accessible to any development tool. For the first time, developers can check out code on their personal devices and work using the most effective and developer-friendly tools, applications, and workflows. CSC has persistent access control over the data on any device it resides. CSC chose to release encryption upon check-in to allow internal repository tools, such as diffmerge, to operate as expected. With DASB, developers' complete assignments in their preferred method, ensuring greater engagement and efficiency.

CSC discovered that DASB was able to address other risks. DASB enforces that source code can only be transmitted to the approved company repository. This eliminated the risk of data leaking into unapproved and unmanaged repositories or locations that are vulnerable to hackers and CSC's competitors.

DASB protects any modification or recreation of data transparently. In this case, DASB

With SecureCircle, we finally have the ability to continuously manage and protect source code after it has left our servers, something no other data security tool delivers to us.

discovered CSC's source code had been copied to numerous locations throughout the enterprise. DASB automatically applied the appropriate access control policies to the newly discovery data. SecureCircle's, content-based Secure Derivative understands the DNA of protected data. When protected DNA is found in another file, regardless of how DNA ended up in the file, that data is automatically extended the same protections and access policies as the original data.

The Outcome

CSC's source code can't be misused. Source code and derivative works are fully protected. Protected data is tracked, and any action is an auditable event. CSC realized considerable cost savings, in addition to, improved morale and productivity among the entire enterprise and external developers. VDI software is no longer used. This lowered license costs and decreased operational overhead. Source code is accessible from any approved device and by any approved process, allowing developers to more efficiently focus on business requirements.

About SecureCircle

SecureCircle's Data Access Security Broker (DASB) delivers a SaaS-based cybersecurity service that extends Zero Trust security to data on the endpoint. At SecureCircle, we believe frictionless data security drives business value for our customers. Instead of relying on complex reactive measures, we simply secure data persistently in transit, at rest, and even in use. End users operate without obstacles, while data is continuously secured against breaches and insider threats.
