IMPORTANT: Swabbing the nostrils is critical for obtaining an accurate result. If you do not swab your nose, the device will produce a false negative result.

Wash your hands thoroughly for at least 20 seconds before the test. Vigorously at least 5 times. Place the swab into the nostril. Then, slowly rotate the swab at least 5 times in a circular path for a total of 15 seconds. Remove the swab from the RIGHT nostril. Gently remove the swab from the LEFT nostril and place directly into the vial upright and place it in the packaging tray.

Test result should not be read after 15 minutes. Start a timer. Disposal of all used test kit components and swab samples in household trash. Do not move or lift the test cassette during this time. Do not exit the mobile app during this process.

The test results will be interpreted by visual reading following the in-app interpretation instructions or provided Quick Reference Instructions.

NOTE: The test results should be read by visual and interpreted at 10 minutes after the sample application and the reading and interpretation of the results should not exceed 15 minutes as it may yield inaccurate results.

COVID-19 Detected (Positive)
One purple-colored line next to “C” and one blue-colored line next to “T” indicates COVID-19 positive result.

A positive test result indicates that antigens from SARS-CoV-2 were detected, and the patient is very likely to be infected with the virus and presumed to be contagious. Test results should always be considered in the context of clinical observations and epidemiological data in making a final diagnosis and patient management decisions. You should self-isolate at home and avoid contact with others as per CDC recommendations to stop spreading the virus to others.

COVID-19 Not Detected (Negative)
One purple-colored line only next to “C” indicates a negative result.

A negative test result indicates that antigens from SARS-CoV-2 were not detected from the specimen. However, a negative result does not rule out COVID-19 and should not be used as the sole basis for treatment or patient management decisions, including infection control decisions. Negative results should be considered in the context of an individual’s recent exposures, history, and the presence of clinical signs and symptoms consistent with COVID-19 and confirmed with a molecular assay, if necessary, for patient management.

Invalid barcode or absence of a purple-colored line next to “C.” Re-test in 24-48 hours if your first test result is negative. An invalid test result indicates that your test has experienced an error and unable to interpret the result of the test. You will need to retest with a new test or consult a healthcare professional. If you still have symptoms, you should self-isolate at home and avoid contact with others prior to the retest.

Ensure you have an internet connection and download the App prior to start the test. Ensure you are using a compatible smartphone. Only open the foil pouch packaging when the App instructed to do so.

Please start the test follows the in-app self-paced, step-by-step test instructions.

1. Download and open App, on/goTM Mobile Application
Download the App on the App Store or Google Play Store. Ensure you are connected to the internet during your test.
2. Answer a few questions in the App
3. Watch the instruction video.
5. Test result
The App will assist in the visual result interpretation. Please follow the instructions provided in the App. You will be required to take a picture of the test device and then look at the device and answer some questions to the result interpretation.

Results
Interpretation

Make sure you wait the full 10 minutes.

The test results will be interpreted by visual reading following the in-app interpretation instructions or provided Quick Reference Instructions.

COVID-19 Detected (Positive)
One purple-colored line next to “C” and one blue-colored line next to “T”. COVID-19 positive result.

COVID-19 Not Detected (Negative)
One purple-colored line next to “C”. Indicates a negative result.

Invalid
Invalid barcode or absence of a purple-colored line next to “C.”

Re-test in 24-48 hours if your first test result is negative.

Invalid barcode or absence of a purple-colored line next to “C.”

Valid
COVID-19 Detected (Positive)
The on/go™ COVID-19 Antigen Self-Test is a rapid, lateral flow immunooassay intended for the qualitative detection of SARS-CoV-2 nucleoprotein antigen from individuals with or without symptoms or other epidemiological reasons to suspect a COVID-19 infection when tested twice over a two or three day window at least 24 hours and not more than 48 hours between tests. The self-collected direct anterior nasal (nares) swab samples from individuals aged 14 years or older are collected anterior nasal swab samples from individuals aged 2 years or older.

Results are for the identification of SARS-CoV-2 nucleoprotein antigen. The antigen is generally detectable in anterior nasal swab specimens during the acute phase of infection. Positive results indicate the presence of viral antigens, but clinical correlation with past medical history and other diagnostic information is necessary to determine infection status. Positive results do not rule out bacterial infection or co-infection with other viruses and the agent detected may not be the definite cause of disease. Individuals who test positive with the on/go™ COVID-19 Antigen Self-Test should self-isolate and seek follow-up care with their physician or healthcare provider as additional testing may be necessary.

What is COVID-19?
COVID-19 is caused by the SARS-CoV-2 virus which is a new virus in humans causing a contagious respiratory illness. COVID-19 can present with mild to severe illness, although some people with COVID-19 can have mild or no symptoms. People with pre-existing clinical conditions may have a higher risk of severe illness from COVID-19. Symptoms of COVID-19 can range from mild to severe, including death. The SARS-CoV-2 virus can be spread to others not just while one is sick, but even before a person shows signs of symptoms of being sick (e.g., fever, coughing, difficulty breathing, etc.).

What are the symptoms of COVID-19?
Many individuals with confirmed COVID-19 have developed fever and/or symptoms of acute respiratory illness (e.g., cough, dyspnea), although some individuals experience only mild symptoms or no symptoms at all. The current information available to characterize the spectrum of clinical illness associated with COVID-19 suggests that, when present, symptoms are usually accompanied with cough, shortness of breath or dyspnea, fever, chills, myalgias, headache, sore throat or new loss of taste or smell, nausea or vomiting. COVID-19 can present with a mild to severe illness, although some people infected with COVID-19 may have no symptoms at all. Signs and symptoms may appear any time from 2 to 14 days after exposure to the virus, and the median time to symptom onset is approximately 5 days.

What is serial testing?
Serial testing is when a single person is tested for COVID-19 more than once. Because antigen tests are less sensitive than other COVID-19 tests and false results may occur, repeated testing may identify more individuals with COVID-19 infection than a single test. By repeating testing, it may be possible to more quickly identify cases of COVID-19 infection and reduce spread of infection. Additional testing with molecular COVID-19 test may be necessary, depending on your individual risk factors and test results.

Frequently Asked Questions
What are the known and potential risks and benefits of COVID-19 testing?
Potential risks include:
- Possible discomfort or other complications that can happen during or after testing.
- Possible incorrect test result (see below for more information).

Potential benefits include:
- The results, along with other information, can help you and your healthcare provider make informed recommendations about your care.
- The results of this test may help limit the potential spread of COVID-19 to your family and others in your community.

What if I have a positive test result?
If you have a positive test result, it is very likely that you have COVID-19 because proteins from the virus that causes COVID-19 were found in your sample. Therefore, it is also likely that you may be placed in isolation to avoid spreading the virus to others. There is a very small chance that this test can give a positive result when the virus is not actually present (false positive). If you test positive with the on/go™ COVID-19 Antigen Self-Test you should self-isolate and seek follow-up care with your healthcare provider as additional testing may be necessary. Your healthcare provider as additional testing may be necessary. Your healthcare provider will work with you to determine how best to care for you based on your test result(s) along with your medical history, and your symptoms.

What if I have a negative test result?
A negative test result means that proteins from the virus that causes COVID-19 was not found in your sample. It is possible for this test to be a negative result because test antigen tests are less sensitive than other COVID-19 tests and false results may occur. In some people with COVID-19, this means you could still have COVID-19 even though the test is negative. In symptomatic people, specimens collected after you have had symptoms for more than five days may be more likely to be negative compared to a molecular assay. If you test negative and continue to experience COVID-19-like symptoms or if you have reason to suspect that you have been exposed to the virus, you should seek follow-up care with your healthcare provider. For example, your healthcare provider may suggest you need another test to determine if you have contracted the virus causing COVID-19 if you are concerned about your COVID-19 infection status after testing or think you may need follow up testing, please contact your healthcare provider.
