# Technical Summary

This document outlines the overall security of the [xBullion](#) smart contracts as evaluated by Zokyo's Smart Contract Auditing team.

The scope of this audit was to analyze and document the xBullion Smart contracts codebase for quality, security, and correctness.

**In our audit, we consider the following crucial features of the smart contract code:**

1. Whether the code is secure.
2. Whether the code corresponds to the documentation (including whitepaper).
3. Whether the code meets best practices in an efficient use of gas, code readability, etc.

## Input

The Smart contract's source code was taken from [the archive](#) provided by the client.

Requirements: [Whitepaper](#).

# Summary

The new updated version of xBullion smart contract was provided for the audit.

Fee processing was simplified: the management fee was removed from SCs code. A new role was added for users so there will be an ability to receive the tokens without any fees. Also, the role usage structure was changed.

The GOLD token contract has passed the auditing process. No issues impacting either the operation or security of the smart contract were identified.
