Patent Landscape Reports

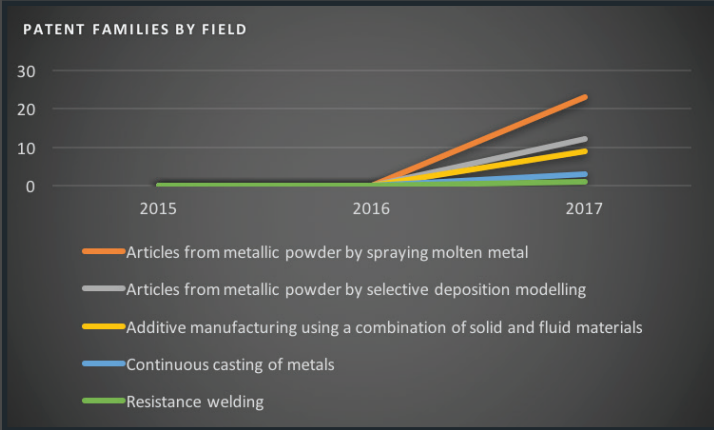

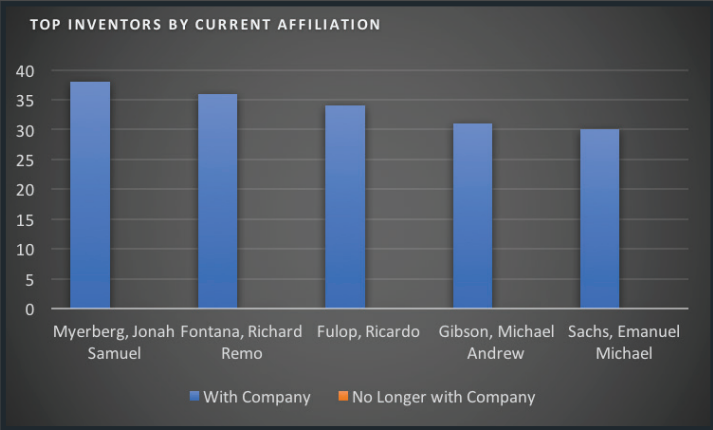

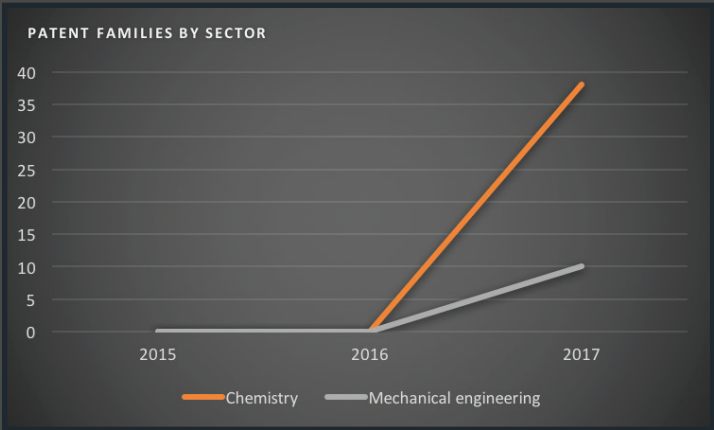

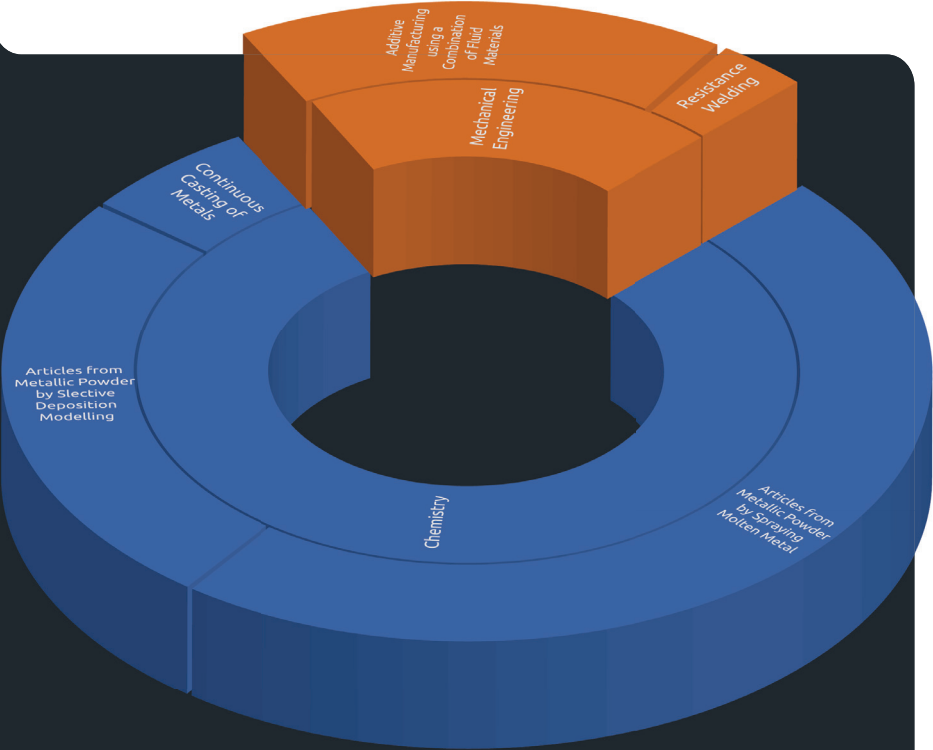

ANALYSIS:

The company's patents began publishing in 2017, and within this year they generated an astonishing 48 publications.

Almost half their portfolio covers articles produced from metallic powder by spraying molten metal, but they also have a significant number of applications for additive manufacturing using a combination of solid and fluid materials.

Being a young company all of the top inventors are still with the organization, and they have not acquired any patents yet.

There are not many citations associated with this portfolio, since it became public recently. However, there is already interest from Stratasy and Battelle.
