

Facility and Ground Preparation

Facility Gound Prep and Irigation System

To manufacture the best vermicompost product, Soil Seed and Water has the high quality systems for irrigation, cooling and water filtration. The optimal water and temperature are extremately important for creating the best enviroment for the worms since they thrive in high levels of moisture and cool temperatures. To be able to achieve such environment, the vermicompost facility is equiped with automated cooling and irrigation systems as well as underground piping that runs throughout the entire facility.

Vermicompost facility

The Soil Seed and Water Vermicompost Facility is stratigically placed in a location where high quality water is optained. This water is comes from the ground and it is analized before use and contains may important minerals. The physical structure of the building is heacy enough to sustain all equipment such as lights. piping, fans, generators and security systems.
