

Do you have a high-risk factor for severe COVID-19?

Nearly 200 million American adults have at least one

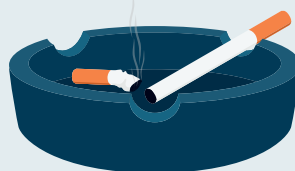

Overweight or obese
(body mass index [BMI]
of ≥ 25 kg/m²)

Older adults
(Age 50 years or over)

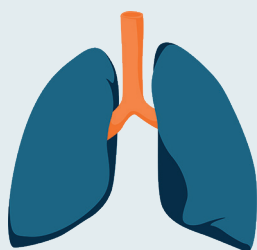

Smoker
(current or former)

Diabetes
(Type 1 or Type 2)

Limited access to healthcare
(in some racial and ethnic minority groups)

Chronic lung diseases
(including moderate-to-severe asthma and COPD)

Heart conditions
(such as heart failure, coronary artery disease, and possibly hypertension)

Mental health conditions
(Mood disorders, including depression, and schizophrenia spectrum disorders)

Other high-risk factors include:

- Cancer
- Chronic kidney disease
- Chronic liver disease
- Cystic fibrosis
- Dementia or other neurological conditions
- Disabilities
- HIV infection
- Immunocompromised condition or weakened immune system
- Physically inactive
- Pregnant or recently pregnant
- Sickle cell disease or thalassemia
- Solid organ or blood stem cell transplant
- Stroke or cerebrovascular disease
- Substance use disorders
- Tuberculosis

Additionally, being unvaccinated or not being up to date on COVID-19 vaccinations increases the risk of severe COVID-19.

If you have even one of these high-risk factors and get COVID-19, oral treatment may be right for you.

Don't delay. Talk to a healthcare provider today.
