Introduction

Trader Wallet is a unique new non-custodial Cryptocurrency wallet, aimed at (but not limited to) the DeFi investor. With Trader Wallet's unique functionalities, users can gain a significant advantage trading new and existing DeFi tokens. Trader Wallet revolutionize the DeFi space and set a new standard for active non-custodial crypto wallets.

Accompanying Trader Wallet, we are launching the TRADER ERC-20 token, which serves as the native token for the Trader Wallet ecosystem. By holding certain amounts of TRADER tokens, investors can unlock different premium and pro functionalities of Trader Wallet.

This whitepaper v1.0 details the most important aspects of Trader Wallet, the tokenomics of the TRADER ERC-20 token and its utility and relation to the wallet, and the roadmap for the development, marketing and publication of our platform.

As we progress the development of our wallet, add functionalities and grow our community, we will continuously assess the need for an update Whitepaper, to include all most recent information. For the latest updates on our platform, any questions, recommendations, or other queries, we encourage you to join our Telegram community, or reach out to us via our official email or Twitter account.

Existing non-custodial crypto wallets, such as MetaMask and TrustWallet, offer a great alternative for people who want to have the sole control over the access of their wallet and for that reason do not like to keep their cryptocurrencies on centralized exchanges. Besides better security, non-custodial wallets are primarily used for investing in DeFi projects. People interested in DeFi projects look to invest in new or young tokens, which in potential can provide extraordinary returns.

The problem with investing in DeFi, however, is that the space is very vulnerable for scams and so-called 'rug pulls'. While there are various signs and indications of these scams hidden in contracts, investors often do not have or do not take the time to go through the contracts before investing, as returns can be lost when investors do not invest quick enough.

While several applications exist to scan contracts on aspects such as the ability to sell, whether or not ownership is renounced, and the ability of the dev to change taxes, existing non-custodial wallets do not offer functionalities to shield investors for investing in malicious contracts and thus losing their money. In addition, most investors do not have the time to navigate to third-party applications to scan contracts. As such, we are developing a wallet which automatically scans contracts before buying.

Moreover, investors can set certain 'locks', preventing them automatically to invest in certain contracts that are malicious and, for example, do not allow selling. This can help investors avoid scams and save their money.

Another problem with investing in DeFi is the growing prevalence of so-called 'snipers', who take advantage of smart contracts or bots to buy tokens seconds after they launch, before regular investors get the chance to get their transaction through. For normal investors, who often do not know how to use these bots, getting decent returns on launches has therefore become significantly harder. Team Wallet will integrate a revolutionary built-in sniper bot into its wallet, which lets any investor 'snipe' contracts, bringing back a leveled playing field in DeFi investing.

Besides a contract scanner and sniper functionality, we are working on several additional functionalities, which existing non-custodial wallets lack, including the possibility for two-factor authentication (2FA) to increase security. All different functionalities are unlocked as investors hold a certain amount of TRADER tokens in their wallet. Simply buy the right amount of TRADER, and instantly gain access to the functionalities relating to that threshold.

More details on the different functionalities, modes and thresholds to unlock the modes of Team Wallet are described in the next sections of this whitepaper.

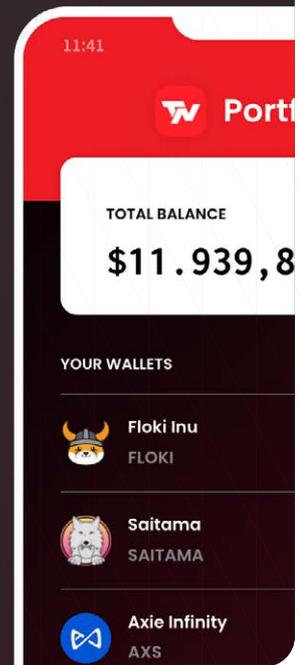

Trader Wallet Basic is the free and most basic version of Trader Wallet. Similar to MetaMask and Trust Wallet, the basic version of Trader Wallet allows users to hold and swap cryptocurrencies and invest in DeFi projects through a built-in browser. Trader Wallet supports various different chains/networks, including the Binance Smartchain and the Ethereum Mainnet.

While this version of Trader Wallet lacks some of the functionalities that make Trader Wallet so revolutionary, it also does not require users to buy or hold any TRADER ERC-20 tokens and is thus completely free to use. Moreover, to gain an advantage over competing non-custodial wallets, Trader Wallet guarantees the lowest transaction costs on crypto swapping/converting. It is also the only non-custodial wallet with a built-in functionality for Two-Factor Authentication (2FA), significantly increasing the security of the platform.

The functionalities of Trader Wallet Basic, as described above, are non-exhaustive. Meaning, we are constantly working on new features and functionalities of all version of the wallet, to make it the most powerful non-custodial platform available.

Basic includes:

- ✓ **0 ETH of TRADER holdings required**
- ✓ **Lowest price guaranteed**
- ✓ **Two-factor Authentication**
- ✓ **Contract Scanner**
- ✓ **Buy Locks**
- ✓ **Built-in Sniper Bot**

Trader Wallet Premium is the first paid version of Trader Wallet. Besides the basic and low cost functionalities of Trader Wallet Basic, the premium version also includes a Contract Scanner and Buy Locks. To gain access to the premium functionalities of the platform, users must hold at least 0.1ETH worth of the TRADER token in their wallet.

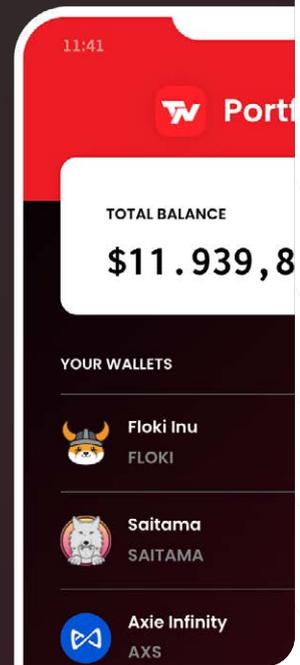

The Contract scanner functionality allows users to scan new and existing contracts on malicious or hidden functions. For example, through the built-in contract scanner, users can be warned that tokens have high taxes, developers have not renounced the contract or can change taxes to 99%, or selling can be disabled. The Contract Scanner also gives other information about contracts, including the max transaction, max wallet and information about taxes.

The Buy locks functionality enables users to set certain prerequisites when buying DeFi contracts through the built-in browsers. For example, in the Settings section of the wallet, users can select that they are unable to buy tokens that do not have the possibility to be sold, of which ownership is not renounced or of which liquidity is not locked. Once certain prerequisites are enabled, buy transactions will fail, preventing users to buy malicious contracts.

The functionalities of Trader Wallet Premium, as described above, are non-exhaustive. Meaning, we are constantly working on new features and functionalities of all version of the wallet, to make it the most powerful non-custodial platform available.

Premium includes:

- ✓ 0.1 ETH of TRADER holdings required
- ✓ Lowest price guaranteed
- ✓ Two-factor Authentication
- ✓ Contract Scanner
- ✓ Buy Locks
- ✓ Built-in Sniper Bot

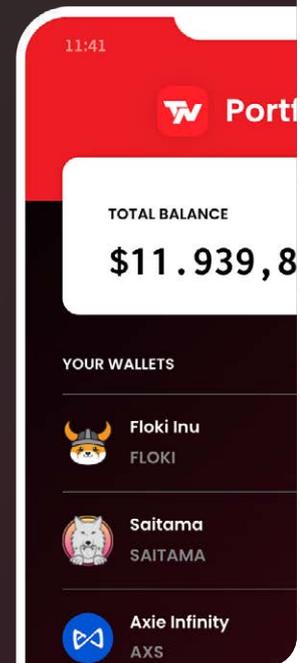

Trader Wallet Pro is the most advanced version of Trader Wallet. The exclusive functionalities of Trader Wallet Pro are unlocked when users hold at least 0.2ETH worth of TRADER tokens in their wallet.

Trader Wallet Pro includes all functionalities of Trader Wallet Premium, including 2FA capabilities, a contract scanner and buy locks. Moreover, Trader Wallet Pro includes a built-in Sniper Bot, which allows users to find newly deployed contracts and buy immediately after liquidity is added by the developer, granting a significant advantage over the regular trader. Moreover, certain parameters can be set to sell tokens at certain milestones / ROI and the Sniper Bot can be combined with the Buy Locks functionalities to prevent investing in malicious contracts.

The functionalities of Trader Wallet Pro, as described above, are non-exhaustive. Meaning, we are constantly working on new features and functionalities of all version of the wallet, to make it the most powerful non-custodial platform available.

Pro includes:

- ✓ 0.2 ETH of TRADER holdings required
- ✓ Lowest price guaranteed
- ✓ Two-factor Authentication
- ✓ Contract Scanner
- ✓ Buy Locks
- ✓ Built-in Sniper Bot

ERC-20 Token

The ERC-20 TRADER token serves as the native currency of the Trader Wallet ecosystem. By holding TRADER, investors gain premium and pro functionalities of the wallet, as described on the previous pages. While the Basic version of Trader Wallet is free, the Premium and Pro versions, which include a contract scanner and sniper bot, can only be accessed by holding certain amounts of TRADER.

The TRADER token has an initial supply of 10 million (10,000,000). Initially, there will be 10% tax, used to fund development and maintenance of Trader Wallet (5%) and help spread the word and fund marketing of our platform (5%). Every 14 days after launch, taxes will be lowered by 1%, to eventually make TRADER a 1% tax token, as development and marketing will mostly be funded by transactions done with our wallet.

The initial liquidity, provided by the developers of the project, will be locked through Team.Finance. Moreover, the TRADER contract will be audited by various third party audit providers, to ensure security and transparency for all holders.

The TRADER token will initially launch on the Ethereum Mainnet, as an ERC-20 token. However, we aim to launch the native currency of Trader Wallet on other chains, including the BSC Smartchain, in the future as well, to expand the reach of the platform and attract more users.

Roadmap

This page details the initial roadmap for the development of the Trader Wallet, the launch of the TRADER ERC-20 token and the formation of our Social Media presence. While we aim to stick to this initial roadmap, the list of functionalities to be added and goals to be achieved are non-extensive and we will constantly be aiming to make our platform the most powerful and user friendly tool for DeFi traders.
