Momento Topics

A serverless event messaging system you can take to prod today.

Topics is a serverless pub/sub service that allows for real-time communication between parts of a distributed application. Instead of spending cycles defining topic resources and dealing with the pain of a tightly-coupled system, push to an unlimited number of channels on the fly **without any topic management**.

Simple Pricing
No complicated pricing schemes here. Free for the first 5GB to/ from Momento per month. Then pay $0.50 per GB.

Managed Infrastructure
Publish to a channel with millions of subscribers without wasting time on sharding nodes and other configurations.

High Scale and High Speed
Seamlessly scale to millions of messages per second while maintaining single-digit milliseconds for tail latencies.

No Connection Management
No complex subscription management, just subscribe and go.

Use Cases

Feature Flag Management
Toggle features on/off instantly across your fleet without redeploying.

Kick Off Asynchronus Workflows
Choreograph complex workflows in the background as events occur.

Upcoming Enhancements

- **Momento executors:** Attach a Lambda function in your AWS account to a topic. Momento will automatically execute these functions for you.

- **Momento triggers:** React to changes on specific item(s) in your cache. You'll be able to set up rules that only notify you when a specific condition is met, like a counter hitting 1000 or key expiring.
