

# Connecting health networks with data integration [Video]

May 25, 2016

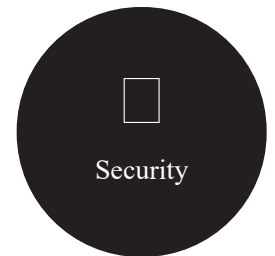

Your home health or hospice care agency may already use electronic records, but have you considered data integration?

A recent survey from the eHealth Initiative and Premier found that nearly 70 percent of Accountable Care Organizations say that they have great difficulty integrating data from specialists, especially ones that are out of network.

A lack of meaningful data exchange isn't just frustrating – it can jeopardize patient health and quality of care. The solution is EHR software optimized for interoperability, ensuring that you can share health data with whatever providers or specialists your patients visit.

Make sure your home health or hospice agency isn't left out in the data-less cold with NDoc software. Contact Thornberry today to learn how to connect your agency.
