Regulatory compliance

Adhering to industry regulations protects the privacy of your clients, reduces costly penalties, and safeguards your reputation.

A document that has been electronically signed must include the following components to be compliant with HIPAA, ESIGN, and UETA:

- Documents can not be tampered with after signing
 - Specifies the terms and intent of the signer while giving the signatory the option of receiving a printed or emailed copy
 - Authenticates all parties to the transaction in some way
- Timestamped, chain of custody, audit trail included to prevent signer repudiations
- Evidence supporting the ownership of the eSignature should remain on the same document held only by the covered entity

our Product takes care of all the technical details in the background, providing you with legally-binding digitally signed documents that meet all compliance requirements.

HIPAA secure eSignature features

#1 Compliance for regulated industries

our Product is more than just an app for doctors and lawyers, it can also be used in other regulated industries such as finance, government, law, and others.

#2 Secure audit trails

With built-in audit trails, our Product automatically records all activity related to the signing of your documents.

#3 We sign BAAs

Covered entities can only work with business associates who will sign Business Associate Agreements. We'll sign them with any customer upon request.

#4 Security & user access

You can determine access controls and permissions for every user with a comprehensive set of admin features. In addition, our enterprise-grade security measures ensure user authenticity to comply with HIPAA requirements.

our Product security

#1 Compliance for regulated industries

- 2-factor authentication (2FA) available and recommended for all users. Automated session timeouts.
- Account level user access, permission controls
- Advanced tracking, reporting, and audit trail features

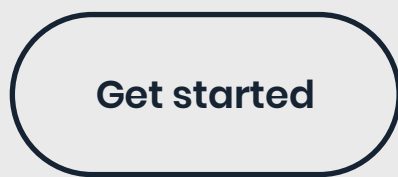

#2 Data encryption and secured connections

- Built on Google Cloud Platform, leveraging all of the power of their multi-layer, progressive security cloud infrastructure
- All files are scrambled using AES 256-bit encryption while in storage and during transfer. TLS 1.2 encryption for files in transit.
- Secure HTTPS connections for both web interface and API

#3 Data center security

- Web servers, application servers, and databases all housed in state-of-the-art SSAE16 secured facilities with redundant hardware, power, and internet connectivity
- Physical access strictly controlled via biometric scanning and 24/7 on-site security
