

WHERE IS AI USEFUL?

CAN AI BE USED IN FINANCIAL MARKETS?

Put 35 years of Human London Financial Markets experience and 35 years of Tech software experience in the melting pot, and what happens? Read on.

They say Artificial Intelligence must learn first before its use. So, what better way than using Human knowledge that is hugely experienced?

It is not so much that AI can be useful; it's more of a matter of how much learning that's done before its use. Better input a few lifetime PhDs than a few GCSEs and certainly, no recalls are welcome. Hence the more grey-haired input, the better, undoubtedly.

Some years ago, we created that melting pot and interviewed very successful financial traders. The result has been an award-winning software product called Azaries. Yep, an all-in oldies knowledgebase, no twenty-somethings yet. And the acid test showed excellent results in all market conditions.

That's an approach that works; there are others, just look at the success of Renaissance, and I quote, "*Renaissance Technologies is an investment management firm that employs mathematical and statistical methods in the design and execution of its investment programs*". One small problem is that while they make billions, it's closed to new investments.

So, the resounding answer to the question is Yes. Indeed, AI can be useful in Financial Markets.
