In a world where sleek design, functionality, and portability have merged seamlessly into one computing experience, Chromebooks have become increasingly popular due to their ease of use and versatility. However, as with any computing device, connecting to Wi-Fi networks is crucial for internet access. The issue often arises when you need to connect another device, like your smartphone or tablet, but can't remember the password. Luckily, there are methods available to help find the Wi-Fi password on your Chromebook. Whether it's a forgotten password to your own network or retrieving a saved Wi-Fi password for troubleshooting or sharing purposes, this article will guide you through various steps to achieve your goal. If you've previously connected to a Wi-Fi network on your Chromebook and saved the password, you can easily retrieve it from the Chrome OS settings: - Click on the network icon in the Chromebook taskbar (located in the bottom-right corner of the screen). - A list of available Wi-Fi networks will appear. - Look for the network for which you want to retrieve the password. - Right-click on the network name and select "Network options" from the drop-down menu. - In the network options window, click on the toggle switch next to "Show password" to reveal the Wi-Fi password. Please note that in order to retrieve the saved Wi-Fi password, you might need to enter the administrator password or provide other authentication credentials. This is to ensure the security of your network and prevent unauthorized access. To find Wi-Fi password on Chromebook, first open Developer Tools window and type "shell" then press Enter to access Crosh Shell. Type "network diag" and press Enter, this will show network diagnostics and options. Note down SSID and BSSID of the network you want to find password for. Then type "network diag -wifi properties " with BSSID and press Enter. This will open a new window showing detailed info about the Wi-Fi network including saved password. You can find the password in the "Security" section. If you are unable to find password using this method, you can check your router settings. Open a web browser on any device connected to the same network and type your router's IP address in the address bar then press Enter. If you don't know the IP address, you can find it in the router's documentation or manufacturer's website. Then enter administrator username and password to access the router settings. Navigate to the section containing Wi-Fi settings or wireless configuration and look for the password field which may be labeled as "Password", "Passphrase", or "Security Key". Take note of the password displayed in the field, if it's not visible look for an option to show or reveal it. This method is helpful when you need to connect other devices to the Wi-Fi network. If you are still unable to find the password using these methods, you can use external tools to retrieve it on your Chromebook by opening the Chrome Web Store and searching for "Wi-Fi password recovery" keywords. Using external tools can be a convenient way to find Wi-Fi passwords on your Chromebook. Several Wi-Fi password recovery apps or extensions will be displayed when searching for them. Choose one that has good ratings and reviews. Click on the app or extension to view more details and click on the "Add to Chrome" button to install it. Once installed, open the Wi-Fi password recovery tool. It will automatically scan and retrieve the saved Wi-Fi passwords on your Chromebook. Look for the Wi-Fi network you're interested in, and the password will be displayed next to it. Using external tools can come with some risks, so ensure that you choose a reputable and trusted tool from the Chrome Web Store to safeguard your security and privacy. You should totally go for LogMeOnce account - it's top-notch! Not only will you have all your passwords and account info in one safe spot, but you can also access them whenever you need to, even when your laptop or device is down.
