Bentley Systems has launched the Bentley Education Program to encourage young engineers and bridge the skills gap in infrastructure design. The program allows students to register directly for access to popular Bentley software applications, such as SYNCHRO, MicroStation, ContextCapture, OpenRoads Designer, and STAAD.Pro. This initiative aims to put Bentley's design and engineering tools into more young hands, widening access to industry resources. The program is built from existing education partnerships, but now students can register directly for access to the software. The goal is to offer something for all levels of interest, from basic concepts to project-based workflows. Many sample projects are based on real-world scenarios, such as designing a bridge or road system. Students will learn tasks and responsibilities within different project team roles, allowing them to work on infrastructure designs in a project-based workflow. The initiative also aims to attract students who might not have considered a career in infrastructure. By focusing on personal progress rather than just offering resources for educators, the program seeks to entice students with varying interests and goals. The program is an effort to level the playing field and provide opportunities for future engineers. With its existing education partnerships still intact, Bentley aims to reach students more directly through this new initiative.
